

Social Media Impact on Teen Behaviour (2015-2060)

A Global Intelligence Dataset on Teen Digital Behaviour, Mental Health, Education, Wellbeing, and Future Risk Forecasting

Overview

The rapid growth of social media has transformed how teenagers communicate, learn, socialize, and spend their time. While digital platforms create opportunities for connection and learning, they also raise concerns about mental health, sleep quality, academic performance, cyberbullying, digital dependency, and overall wellbeing.

This dataset provides a comprehensive global simulation of teen behavioural patterns influenced by social media usage from 2015 to 2060. It is designed for data science, machine learning, forecasting, educational research, psychology studies, public health analysis, and AI-driven policy insights.

The dataset combines behavioural, psychological, physical, academic, family, and digital safety indicators to help researchers explore the complex relationship between social media usage and adolescent development.

PROBLEM STATEMENT

- 1.Which countries have the highest average social media usage?**
- 2.Which age group spends the most time on social media?**
- 3.Does higher screen time increase addiction score?**
- 4.Which countries have the highest mental health risk?**
- 5. Which continent has the highest digital wellbeing?**
- 6. How does sleep affect mental health?**
- 7.Which age group has the highest academic risk?**
- 8.Which income group experiences the highest cyberbullying?**
- 9. Which regions have the highest problematic social media use?**
- 10.Which countries have the worst overall wellness score?**

11. Which continent has the highest cyberbullying rate?
